Description

For my project I want to make a scrollspy navigation designed website. The nav will be fixed at the top and horizontal. Instead of the nav links sending the user to another page, the links will call a certain section to the top of the screen.

Pseudocode

1. User clicks on “contact” link in the nav
2. Webpage then scrolls underneath nav to show “contact” section of page

Assumes: user can click

Visual Example

http://www.teamgeek.co.za/

Test Procedure

To test the program, I will begin by building it step-by-step in Aptana Studio. I’ll have my website open on a second monitor with a 5 second refresh loop on the browser so I can immediately see if I messed up anything with each change I make.
